3 What We Learned

4 Conclusions

Some Things That GTOC Taught Us

L. Casalino

Introduction

Competitions

What We Learned

Conclusions

- the Global Trajectory Optimisation Competition was inaugurated in 2005 originating from an idea by Dario Izzo of the Advanced Concepts Team, European Space Agency
- participating teams are invited to solve a high-complexity space trajectory global optimization problem
- purposes
 - test existing optimization methods
 - stimulate new ideas
 - involve people from different fields (e.g., mathematicians) with their specific knowledge

Competition

Some Things
That GTOC
Taught Us

L. Casalino

Introduction

Competitions

What We
Learned

Conclusions

- 4 weeks to solve the proposed problem
- clear rules to classify the solutions and ensure a competition winner
- the winning team organizes the next competition (schedule, problem definition, rules, etc.)

Problems

Some Things
That GTOC
Taught Us

L. Casalino

Introduction

Competitions

What We
Learned

Conclusions

- the design space is large and a large number of local optima exist;
- the problem is complex but not overwhelming, and should be solved within the prescribed 4-week time frame;
- the mathematical formulation is sufficiently simple so that it should also be solved by researchers not experienced in astrodynamics;
- even though registered teams may have developed tools for the analysis of the proposed kind of mission, the problem peculiarities should make it new to all the teams

Features

Some Things
That GTOC
Taught Us

L. Casalino

Introduction

Competitions

What We
Learned

Conclusions

- combinatorial problem:
 - define sequence of gravity assists
 - select targets among a large set
 - select sequence of specified targets
- trajectory problem:
 - low-thrust (or continuous-thrust)
 - impulsive-thrust

GTOC1: Save the Earth

Some Things
That GTOC
Taught Us

L. Casalino

Introduction

Competitions

What We
Learned

Conclusions

- maximize the energy change of a potentially hazardous asteroid with a kinetic impactor equipped with low thrust propulsion
- winner: Jet Propulsion Laboratory (JPL)
- key: gravity assists to achieve a retrograde orbit

GTOC2: Multiple Asteroid Rendezvous

Some Things
That GTOC
Taught Us

L. Casalino

Introduction

Competitions

What We
Learned

Conclusions

- low-thrust spacecraft must rendezvous with one asteroid from each of four defined groups of asteroids while maximizing the ratio of final spacecraft mass to flight time
- winner: Politecnico di Torino
- key: exploit orbit geometry for transfers

GTOC3: Multiple Sample Return

Some Things
That GTOC
Taught Us

L. Casalino

Introduction

Competitions

What We
Learned

Conclusions

- low-thrust spacecraft launches from Earth, must rendezvous with three asteroids from a specified group of NEAs and finally rendezvous with the Earth, while maximizing a function of final mass and stay-time on the asteroids
- winner: Centre National d'Etudes Spatiales (CNES)
- key: simplified global search + separate local optimization of each leg

GTOC4: Asteroid Billiard

Some Things That GTOC Taught Us

L. Casalino

Introduction

Competitions

What We
Learned

Conclusions

- maximize the number of asteroids visited by a low-thrust spacecraft en route to rendezvous with another asteroid
- winner: Moscow State University
- key: build long chains of connected asteroids

GTOC5: Penetrators

Some Things That GTOC Taught Us

L. Casalino

Introduction

Competitions

What We
Learned

Conclusions

- maximize number of visited asteroid by a low-thrust spacecraft, which must first rendezvous and then perform a flyby of each asteroid propulsion
- winner: define (restricted) set of feasible transfers between asteroids for global search

GTOC6: Mapping of Galilean Moons

Some Things
That GTOC
Taught Us

L. Casalino

Introduction

Competitions

What We
Learned

Conclusions

- maximize the number of regions mapped by a low-thrust spacecraft, where mapping requires to perform a flyby with periapsis above the region
- winner: Politecnico di Torino - Università di Roma Sapienza
- key: exploit tools to design resonant/non resonant transfers + adjust timing with propulsion

GTOC7: Multi-Spacecraft Exploration the Asteroid Belt

Some Things
That GTOC
Taught Us

L. Casalino

Introduction

Competitions

What We
Learned

Conclusions

- maximize the number of Main Belt asteroid visited by three exploration probes; probes are released by and must return to a mothership
- winner: Jet Propulsion Laboratory (JPL)
- key: global search techniques

GTOC8: Very Large Baseline Interferometry

Some Things
That GTOC
Taught Us

L. Casalino

Introduction

Competitions

What We
Learned

Conclusions

- maximize an index related to the number of radio sources observed by three low-thrust spacecraft in formation, quality of observation, source location; lunar gravity assists are allowed
- winner: ESA's Advanced Concepts Team - JAXA
- key: Moon gravity assists and resonances to achieve high orbits

GTOC9: Kessler Run

Some Things That GTOC Taught Us

L. Casalino

Introduction

Competitions

What We
Learned

Conclusions

- remove 123 space debris objects with multiple launches while minimizing an index related to masses at launch; each launch sends a spacecraft to an object, and the spacecraft moves with impulsive thrust to reach additional objects
- winner: Jet Propulsion Laboratory (JPL)
- key: global search capabilities + transfer cost estimation

GTOC10: Settlers of the Galaxy

Some Things
That GTOC
Taught Us

L. Casalino

Introduction

Competitions

What We
Learned

Conclusions

- maximize an index related to the number of colonized galaxies and their spatial distribution (futuristic propulsion technology)
- winner: National University of Defense Technology / Xi'an Satellite Control Center
- key: galactic Lambert problem + tree development + global coverage

GTOC11: Dyson Sphere

Some Things
That GTOC
Taught Us

L. Casalino

Introduction

Competitions

What We
Learned

Conclusions

- maximize an index related to the total mass of asteroids moved to the vicinity of the sun with a futuristic propulsion technology
- winner: Tsinghua University - Shanghai Institute of Satellite Engineering
- key: Lambert solver and global search + mass distribution among stations + increasing the number of asteroids may decrease the index

GTOC12: Asteroid Mining

Some Things That GTOC Taught Us

L. Casalino

Introduction

Competitions

What We
Learned

Conclusions

- maximize the mass collected on multiple asteroids by low-thrust ships and returned to the Earth (the mass from each asteroid is weighted with a bonus factor)
- winner: Jet Propulsion Laboratory (JPL)
- key: *??? I had no time to study the problem (academic responsibilities conflict with research work) !!!*

Direct Versus Indirect Methods

Some Things
That GTOC
Taught Us

L. Casalino

Introduction

Competitions

What We
Learned

Conclusions

- direct and indirect methods are the techniques traditionally employed in space trajectory optimization
- direct methods: more robust but more computationally expensive
- indirect methods: usually faster but need tailored tentative solutions
- GTOC results seem to show that both method are mostly equally effective

Local Versus (?) Global

Some Things
That GTOC
Taught Us

L. Casalino

Introduction

Competitions

What We
Learned

Conclusions

- global and local optimization techniques are often seen a juxtaposed methods
 - global search for the combinatorial problem
 - local search for the trajectory optimization problem
- however
 - global exploration is only feasible on reasonable-size sets: pruning and cost estimations are required (i.e., some sort of local optimization is needed)
 - local search can only be applied to subsets that can only be defined with global search methods
- is there any difference ?

What Has Changed in 18 Years

Some Things
That GTOC
Taught Us

L. Casalino

Introduction

Competitions

What We
Learned

Conclusions

- complexity of the problems has increased exponentially:
from a few objects and gravity assists to thousands of
objects and hundreds of gravity assists
- computational power has also grown and allows for more
exhaustive global search
- are we going to stress G (global) versus T (trajectory) in
GTOC?

Knowledge and Tools

Some Things
That GTOC
Taught Us

L. Casalino

Introduction

Competitions

What We
Learned

Conclusions

- non-exhaustive list of GTOC fruits
 - strategies to define tentative solutions for legs and leg-joining
 - orbital parameters are a useful pruning tool but false-negative may affect the solutions
 - Edelbaum approximation can be adapted to non-circular orbits
 - Lambert problem can be used for low-thrust arc approximation (but only for short burn arcs)
 - design of Moon tours: try to use 1:1 resonance when time constraints are present
 - optimal noncoplanar geocentric transfers exploiting J_2
 - better having global search capabilities ready (or start developing them!)

Personal Notes

Some Things That GTOC Taught Us

L. Casalino

Introduction

Competitions

What We
Learned

Conclusions

- people can work 20 hours a day when sufficiently motivated !!!
- only join GTOC if people around you (either parents, spouse, or children, whatever is your family situation) are very patient
- my daughter was born on December 5th 2005, the day solutions for GTOC1 were due: I was tempted to give her the name “GTOC” but then went with Sara (and she is very grateful for this)
